

Two Block Tie and Elastomer Boot System

L.B. Foster Company Transit Products first supplied two block tie and elastomer boot systems in the early 1980's. This product is designed to provide our customers with the following:

- ▶ Rapid and efficient slab track construction.
- ▶ Noise and vibration mitigation in certain frequency ranges.
- ▶ Rail electrical isolation from surrounding structure.
- ▶ Improved lateral restraint in curved ballasted track applications.

The two block and elastomer booted systems can be provided either:

- ▶ With a gage bar, as shown in the picture below; or
- ▶ Without the bar with deeper engagement of the system within the concrete structure to provide gage widening restraint.

This product can be provided for any rail section.
